Our 3 sentences...

If you look at a cat toes, they have 5 toes

On their front paws, while they have 4 toes on the

Back. But, with a dog, they have only 4 pads,

Each with a toe. Only on some cases dogs

have what they call a "dew paw" which is a

"5th claw" that doesn't touch the ground...so,

maybe you can have an inepad on the floor,

and the animals can walk on it... then a

Machine could count the print easily.
