Problem Statement: How can you identify a cat from a dog?

Approach: We had to write 3 sentences on how you could identify a dog from a cat.

(Sentences Below)

If you look at a cat toes, they have 5 toes On there front paws, while they have 4 toes on the back.

But, with a dog, they have only 4 pads, each with a toe. Only on some cases dogs have what they call a "dew paw" which is a "5th claw" that doesn't touch the ground...so, maybe you can have an inkpad on the floor, and the animals can walk on it... that a machine could count the print easily.

Solution: Apparently, the temperature's of a cat and a dog were different.

Lessons Learned: Be careful with your sources
